

DATA MIGRATION & DATA WAREHOUSE

WHAT IS THE DIFFERENCE?

Data migration (DM) and Data warehouse (DWH) are constructed with comparable toolsets, but that's where the similarities end.

DM

DWH

Has a beginning and an end - often part of a larger system implementation

Project

Process

Filled on a regular basis and used continuously

The program is the client

One client

Many clients

Several user groups

In production for a couple of hours

Hours

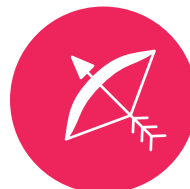

Years

In production for a long time

Designers must understand data usage and processes of target system

Target

Source

Designers must understand how to integrate data from several sources

May use DWH reporting as migration verification

Verification

Report

You're welcome!

What is data migration?

Transform data of a source system in such a way that the target system works correctly with this transformed data.

What is a data warehouse?

Store data from several systems to enable analysis of data to support decision making and reporting.
